

ILLUSTRIOUS TONEARM

Some commentators estimate that up to 70% of front end performance can be attributed to the tonearm - The illustrious arm more than lives up to its name in representing the summit of replay equipment. This arm will release the full performance available from your vinyl collection.

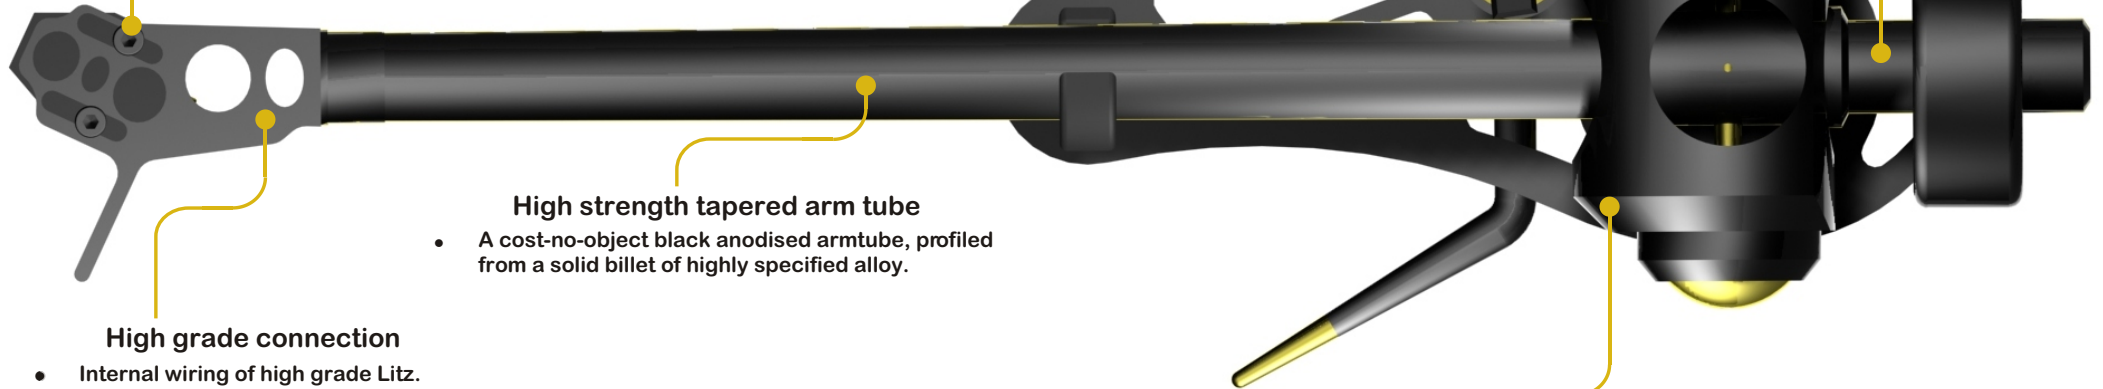

Advanced headshell & wiring

- High strength, low mass sculpted headshell machined from solid alloy block to include flanges. The headshell is also decoupled and rigidly attached to the armtube. These aspects deliver a tangible quality to the music due to lowered resonance and increased stability.
- Headshell wires are silver plated and insulated in robust PTFE.
- Gold plated copper beryllium cartridge tags.

Counterweight & bearings

- Rear Stub and counterweight design is the same as the highly acclaimed Origin live Rega structural modification.
- All bearings are the most highly specified of our range. In addition they are positioned outside the arm tube and widely spaced in an advanced bearing house. This reduces resonance within the tube and increases torsional stability - both of which result in very marked improvements over conventional arms.

High strength tapered arm tube

- A cost-no-object black anodised armtube, profiled from a solid billet of highly specified alloy.

High grade connection

- Internal wiring of high grade Litz.
- Special external wiring selected from hundreds tested.
- High grade aluminium phono plugs with over twice the conductivity of brass phono connectors resulting in a very audible improvement in the sound.

Advanced arm base

- Specially designed arm base incorporates a revolutionary advanced bearing house designed to provide isolation from vibration.
- Construction employs a large number of specially selected materials in order to optimise performance.
- Incorporates highly accurate and infinitely variable side bias adjustment.
- Includes an infinitely variable VTA adjuster.
- Can be directly substituted for any Rega arm as the fitting is to the same dimensions as a standard Rega.
- Easily fitted to the Linn LP12 (a pre-drilled arm board for the Linn is also available).
